

## Chapter 10

### Environmental Health and Toxicology

### This lecture will help you understand:

- Environmental health hazards
- Toxicants in the environment
- Hazards and their effects
- Risk assessment and risk management
- Philosophical approaches to risk

### Central Case: Lake Apopka alligators

- In 1985, alligators in Lake Apopka, Florida, had bizarre reproductive problems
  - Non-viable eggs, depressed or elevated hormone levels
- The lake had high levels of agricultural chemicals and fertilizers that were disrupting the endocrine systems of alligators during development in the egg.
  - **Endocrine disruptors:** compounds that mimic hormones and interfere with the functioning of animals' endocrine (hormone) systems
- Because alligators and humans share the same hormones, chemicals can affect people, too.

### There are many types of environmental hazards

- **Environmental health:** assesses environmental factors that influence human health and quality of life
- There are 4 major types of environmental hazards:
  - Physical
  - Chemical
  - Biological
  - Cultural
- Much of environmental health consists of taking steps to address the impacts and risks of hazards.
  - We can't avoid risk, but we can minimize its effects.

## Chemical and biological environmental hazards

- **Physical hazards:** occur naturally in our environment
  - Earthquakes, volcanoes, fires, floods, droughts
  - Ultraviolet radiation from sunlight damages DNA.
  - We increase our vulnerability by deforesting slopes (landslides), channelizing rivers (flooding), etc.
  - We can reduce risk by making better environmental choices.
- **Chemical hazards:** synthetic chemicals such as pesticides, disinfectants, pharmaceuticals
  - Harmful natural chemicals also exist.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Cultural environmental hazards

- **Biological hazards:** result from ecological interactions
  - Viruses, bacteria, and other pathogens
  - **Infectious (communicable, or transmissible) disease:** other species parasitize humans, fulfilling their ecological roles
  - We can reduce the likelihood of infection.
- **Cultural (lifestyle) hazards:** result from the place we live, our socioeconomic status, our occupation, our behavioral choices
  - Smoking, drug use, diet and nutrition, crime, mode of transportation

## Disease is a major focus of environmental health

- Despite our technology, disease kills most of us.
- Disease has a genetic and environmental basis.
  - Cancer, heart disease, respiratory disorders
  - Malnutrition, poverty, and poor hygiene can foster illnesses.

(a) Leading causes of death across the world

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Infectious diseases kill millions

(b) Leading causes of death by infectious disease  
Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

- Infectious diseases kill 15 million people per year.
  - Half of all deaths in developing countries
  - Developed countries have better hygiene, access to medicine, and money.
- **Vector:** an organism that transfers pathogens to a host

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## Many diseases are increasing

- Tuberculosis, acquired immunodeficiency syndrome (AIDS), and the West Nile virus are increasing.
  - Our mobility spreads diseases.
- Some diseases are evolving resistance to antibiotics.
- Climate change will expand the range of diseases.
- Habitat alteration affects the abundance, distribution, and movement of disease vectors.

## We are exposed to many hazards

TABLE 14.1 Selected Environmental Hazards

### Air

- ▶ Smoking and secondhand smoke
- ▶ Chemicals from automotive exhaust
- ▶ Chemicals from industrial pollution
- ▶ Tropospheric ozone
- ▶ Pesticide drift
- ▶ Dust and particulate matter

### Water

- ▶ Pesticide and herbicide runoff
- ▶ Nitrates and fertilizer runoff
- ▶ Mercury, arsenic, and other heavy metals in groundwater and surface water

### Food

- ▶ Natural toxins
- ▶ Pesticide and herbicide residues

### Indoors

- ▶ Asbestos
- ▶ Radon
- ▶ Lead in paint and pipes
- ▶ Toxicants in plastics and consumer products

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## Environmental health hazards exist indoors

- **Radon:** a highly toxic, colorless, undetectable radioactive gas
  - Builds up in basements
  - Can cause lung cancer
- **Lead poisoning:** from lead pipes, paint
  - Damages organs, learning problems, behavior abnormalities, death
- **Asbestos:** insulates against heat, cold, sounds, and fire
  - **Asbestosis:** scarred lungs don't function
  - Also causes a type of lung cancer

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

*Asbestos removal can also be dangerous*

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## A recently recognized hazard

- **Polybrominated diphenyl ethers (PBDEs):** has fire-retardant properties
  - Used in computers, televisions, plastics, and furniture
  - Persist and accumulate in living tissue
  - Affect thyroid hormones, may cause cancer, and affect brain and nervous system development
  - The European Union banned them in 2003.
  - The U.S. has not addressed this issue.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Toxicology is the study of poisonous substances

- **Toxicology:** the study of the effects of poisonous substances on humans and other organisms
- **Toxicity:** the degree of harm a chemical substance can cause
  - “The dose makes the poison”: toxicity depends on the combined effect of the chemical and its quantity
- **Toxicant:** any toxic or poisonous agent
- During the past century, we have produced many new chemicals.
  - Public concern for health and the environment

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Environmental toxicology

- Deals with toxic substances that come from or are discharged into the environment
- Focuses mainly on humans, using other animals as test subjects
  - Animals can serve as indicators of health threats.
- Don't forget: chemicals have played a crucial role in giving us our high standard of living.
  - Food, medicine, materials, convenience

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Toxic agents in the environment

- The environment contains countless natural chemicals that may pose health risks.
- But synthetic chemicals are also in our environment.
  - Every human carries traces of industrial chemicals.
- Very few chemicals have been thoroughly tested.
  - 100,000 chemicals are on the market today.
  - We don't know the effects, if any, they have.

*80% of U.S. streams contain at least trace amounts of 82 wastewater contaminants.*

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Silent Spring began public debate over chemicals

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

- Rachel Carson published *Silent Spring* in 1962.
  - Brought together studies to show DDT risks to people, wildlife, and ecosystems
  - In the 1960s, pesticides were mostly untested and were sprayed over public areas, assuming they would do no harm.
- The book generated significant social change.

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## Types of toxicants based on health effects

- **Carcinogens:** cause cancer
- **Mutagens:** cause DNA mutations
  - Can lead to severe problems, including cancer
- **Teratogens:** cause birth defects
- **Neurotoxins:** assault the nervous system
  - Heavy metals, pesticides, chemical weapons
- **Allergens:** overactivate the immune system
- **Endocrine disruptors:** interfere with the endocrine (hormone) system

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## Endocrine disruption may be widespread

- Theo Colburn wrote *Our Stolen Future* in 1996.
  - Synthetic chemicals may be altering hormones.
  - This book integrated scientific work from various fields.
  - Shocked many readers and brought criticism from the chemical industry

(a) Normal hormone binding

(b) Hormone mimicry

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## Evidence for hormone disruption

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

- Frogs also have gonadal abnormalities.
  - Male frogs exposed to very low levels of atrazine became feminized.
  - Levels were below EPA standards for human health.

- The shocking drop in men's sperm counts may be due to endocrine disruptors.

(a) Declining sperm count in men, based on 61 studies

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## Endocrine disruption research is controversial

- Scientific uncertainty is inherent in any young field.
- Negative findings pose economic threats to chemical manufacturers.
  - Bisphenol-A, used in plastics, causes birth defects, but the plastics industry protests that the chemical is safe.
  - Phthalates affect male fetuses but are still used in toys and makeup in the U.S.

(a) Exposure through toys

## Toxicants are found in water and air

- Water carries toxicants from land areas to surface water.
  - Chemicals can leach through the soil into groundwater.
  - Chemicals enter organisms through drinking or absorption.
  - Aquatic organisms (fish, frogs, stream invertebrates) are effective pollution indicators.
- Because chemicals can travel by air, their effects can occur far from the site of use.
  - **Pesticide drift:** airborne transport of pesticides
  - Synthetic chemical contaminants are found globally.
    - Arctic polar bears, Antarctic penguins, and people living in Greenland

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## Routes of chemical transport

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## Some toxicants persist

- Toxins can degrade quickly and become harmless.
  - Or they may remain unaltered and persist for decades.
  - Rates of degradation depend on temperature, moisture, and sun exposure.
- Persistent chemicals have the greatest potential for harm.
- **Breakdown products:** toxicants degrade into simpler products
  - May be more or less harmful than the original substance
  - i.e., DDT degrades into DDE, which is also highly persistent and toxic

Copyright © 2009 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

## Toxicants can accumulate and biomagnify

- Some toxicants can be excreted or metabolized.
  - Fat-soluble toxicants are stored in fatty tissues.
- **Bioaccumulation:** toxicants build up in animal tissues
- **Biomagnification:** toxicants concentrate in top predators
  - Near extinction of peregrine falcons, bald eagles, and brown pelicans

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Not all toxicants are synthetic

- Chemical toxicants also exist naturally and in our food.
  - Don't assume natural chemicals are all healthy and synthetic ones are all harmful.
- Scientists are debating just how much risk natural toxicants pose.
  - Plants produce toxins to ward off herbivores.
  - When we consume meat, we take in toxins the animals have ingested.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Studying the effects of hazards

- Animals in the wild are observed to determine the cause of sickness or death.
- In human health studies, researchers study and treat sick individuals.
- **Epidemiological studies:** large-scale comparisons between groups of people
  - Studies between exposed and unexposed people last for years.
- Animals are used as subjects to test toxicity.
  - Rats, mice, other mammals

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Dose-response analysis

- **Dose-response analysis:** measures how much effect a toxicant produces at different doses
  - Animal testing
  - **Dose:** the amount of toxicant the test animal receives
  - **Response:** the type or magnitude of negative effects
  - **Dose-response curve:** the plot of the dose given against the response
    - Looks at lethal doses (**LD<sub>50</sub>**) or effective doses (**ED<sub>50</sub>**)

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Dose response curves

- **LD<sub>50</sub>/ED<sub>50</sub>**: the amount of toxicant required to kill (affect) 50% of the study animals used
  - A *high* LD<sub>50</sub>/ED<sub>50</sub> indicates *low* toxicity.
- **Threshold**: the dose level where certain responses occur
  - Organs can metabolize or excrete low doses of a toxicant.
  - Some toxicants that work at extremely low levels show a J-shaped, U-shaped, or inverted curve.
- Scientists extrapolate downward from animal studies to estimate the effect on humans.
  - Regulatory agencies set allowable limits well below toxicity levels from lab studies.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Individuals vary in their responses to hazards

- Different people respond differently to hazards.
  - Affected by genetics, surroundings, etc.
  - People in poor health are more sensitive.
  - Sensitivity also varies with sex, age, and weight.
  - Increased sensitivity in fetuses, infants, and children
- Standards for responses are set by the Environmental Protection Agency (EPA).
  - Often, standards are not low enough to protect babies.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## The type of exposure affects the response

- **Acute exposure**: high exposure for short periods of time to a hazard
  - Easy to recognize
  - Stem from discrete events: ingestion, oil spills, nuclear accident
- **Chronic exposure**: low exposure for long periods of time to a hazard
  - More common but harder to detect and diagnose
  - Affects organs gradually: lung cancer, liver damage
  - Cause and effect may not be easily apparent.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Mixes may be more than the sum of their parts

- It's hard to determine the impact of mixed hazards.
  - They may act in ways that cannot be predicted from the effects of each in isolation.
- **Synergistic effects**: interactive impacts that are more than or different from the simple sum of their constituent effects
  - Mixed toxicants can sum, cancel out, or multiply each other's effects.
  - New impacts may arise from mixing toxicants.
- Single-substance tests receive priority but this is changing.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Risk assessment

- The steps between obtaining scientific data and policy formulation involve assessing and managing risk.
- **Risk:** the probability that some harmful outcome will result from a given action, event, or substance
  - Exposure to a health threat doesn't always produce an effect.
  - Rather, it causes some probability (likelihood) of harm.
- Probability entails:
  - Identity and strength of threat
  - Chance and frequency of an encounter
  - Amount of exposure to the threat
  - An organism's sensitivity to the threat

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Perceiving risks

- Everything we do involves some risk.
- We try to minimize risk, but we often misperceive it.
  - Flying versus driving
- We feel more at risk when we cannot control a situation.
  - We fear nuclear power and toxic waste, but not smoking or overeating.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Approaches to determining safety

- Two philosophies categorize a substance as safe or harmful.
  - Are businesses required to prove a product is safe, or are the government, scientists, or citizens required to prove danger?
- **Innocent until proven guilty approach:**
  - Assume products are harmless until proven harmful.
  - Benefits: not slowing down technological innovation and economic advancement
  - Disadvantage: putting into wide use some substances that may turn out to be dangerous

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Another approach to determining safety

- **Precautionary principle approach:**
  - The government, scientists, and the public are required to prove a product is dangerous.
  - Assume substances are harmful until they are proven harmless
  - Identifies troublesome toxicants before they are released
  - But this may impede the pace of technology and economic advance

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Two approaches for determining safety

Copyright © 2008 Pearson Education, Inc., publishing as Pearson Benjamin Cummings

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Philosophy affects policy

- Most nations use a mix between the “innocent until proven guilty” principle and the precautionary principle.
  - Europe is shifting more toward the precautionary principle.
  - The U.S. generally follows the “innocent until proven guilty” approach.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## The EPA regulates many substances

- Federal agencies share responsibility for tracking and regulating synthetic chemicals.
  - FDA: food, food additives, cosmetics, drugs, medical devices
  - EPA: pesticides
  - Occupational Safety and Health Administration (OSHA): workplace hazards
- Many public health and environmental advocates fear it isn't enough.
  - Many synthetic chemicals are not actually tested.
  - Only 10% have been tested for toxicity.
  - Fewer than 1% are government regulated.

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## International regulation of toxicants

- Nations address chemical pollution with international treaties.
- **Stockholm Convention on Persistent Organic Pollutants (POPs)** is nearing ratification.
  - Ends the release of the 12 most dangerous POPs (“dirty dozen”)
- EU's Registration, Evaluation, Authorization, and Restriction of Chemicals (REACH) Program (2007)
  - Aims to evaluate and restrict dangerous chemicals while giving industries a streamlined regulatory system
  - It will cost the chemical industry 2.8–5.2 billion euros (U.S. \$3.8–7.0 billion), but public benefits will exceed 50 billion euros (\$67.0 billion).

Copyright © 2009 Benjamin Cummings is an imprint of Pearson

## Conclusion

- International agreements represent a hopeful sign that governments are working to protect people, wildlife, and ecosystems from toxic chemicals and environmental hazards.
- Once all the scientific results are in, society's philosophical approach to risk management will determine what policies are enacted.
- A safe and happy future depends on knowing the risks that some hazards pose and on replacing those substances with safer ones.
